Q: Is it possible to populate a tableview from another thread? I have a question about threading and the GUI. Select any rectangle, ellipse, circle, polyline, spline, or path and start typing, which will trigger the import of that geometry. Work directly in the document – no need to open it up. This is possible because AutoCAD designates a separate area to hold your drawing and lets you work on that area while you import your data. In addition to the rectangle, ellipse, circle, polyline, and spline, you can import arcs and curves (as paths). Import geometry from any of these shapes and copy it into any other AutoCAD element – at the same time, you can select which of the data is to be imported to

any part of the drawing, and you can also export the data to any other file format. You can then edit the imported data and, when satisfied, send the changes back to the original source. You can continue to work on the imported data until it's ready, and you can make changes in any part of the drawing at any time. When you're satisfied with the imported data, use Update.
