heroes of might and magic 3 crack cdgolkesQ: Why do the monthly shots hurt more? I do the monthly flu shots, and the every other week one. The every other week one does not hurt nearly as much, but the monthly one hurts much more. I am now on the third month. My dad gave me the same advice as I have heard from everyone else. Basically it's because my body has acclimated to the shots. Also that it would hurt more if I didn't have the shots. I am wondering if it is true that my body has acclimated. So what is the reason behind the increase in pain from the monthly shots? A: As they said the body adapts to the shot, it becomes less sensitive to the pain and you feel less. I've always said, if it hurts less after the first one, then the second one will be just as painful. The key is to keep getting the shot. After the first shot, you have a natural immunity to the virus, making the shot almost pain free. After the second, it's just the effects of the first shot worn off. For the every other week shot, at least for me, the pain is actually lessened due to the immunity. Could radiotherapy be modified to benefit patients with small cell lung cancer? An increasing proportion of patients with small cell lung cancer are receiving radiotherapy as part of the "whole brain" approach. Concurrent small cell lung cancer radiotherapy with platinum-based chemotherapy is considered standard care. It has not been established, however, whether radiotherapy used alone, or in combination with other regimens, achieves a higher proportion of local tumour control and allows a larger proportion of patients to live outside the radiotherapy unit. This review discusses the evidence from randomised controlled trials of adjuvant radiotherapy for patients with early-stage (stage I-II) and locally advanced (stage IIIA-IIIB) small cell lung cancer. The main conclusions are that radiotherapy concurrent with chemotherapy may improve local tumour control compared with radiotherapy after chemotherapy in both patients with stage I and II tumours (but not in stage IIIA tumours), and that treatment after concurrent radiotherapy plus chemotherapy is less effective than radiotherapy concurrent with chemotherapy in patients with stage I-II tumours (but not in those with stage IIIA-IIIB tumours). The reviewed trials showed that
