
Nec Display Wall Calibrator Serial Number

Another 14 pages of calibration data. I know I've barely scratched the surface. I'm not going to do this again and concentrate on the low-level stuff until I'm sure I've got the IQI involved in the process. I spent so much time on this part of the process that I'm going to concentrate on the high level stuff this week. How and why did I even get to this point? Well, I started off with the idea of running the test cable through the back of the monitor and then plugging the two ends into the desk-top computer. Both the luminance and the color checker would connect via the "PC" port on the Data Card and the TV was connected to the "DP" port via a DVI to HDMI adaptor. I plugged the calibration cable in and the Wall Calibrator site worked fine. I noticed a rather small red light was flashing on and off, but I managed to gather it was just some sort of error code. I moved on to sending a test file to the Wall Calibrator. This proved to be a big mistake. The program wouldn't accept the ICPro PT. I repeated this five or six times before I tried a DVI cable and a DP video cable. Both worked. I even ran this test through a PC running Windows 8, but that didn't work. So that brings us up to April 2017. A few months ago I bought a NEC DP-B1 monitor from my brother. With both the monitor and the Wall Calibrator connected to my computer with a DVI cable, I had the same problem: the Wall Calibrator wouldn't connect. I tried another DVI cable, but it didn't help. Finally, I bought a DVI-D cable to DVI-D port on the Wall Calibrator. Now the Wall Calibrator site works! Wow, what's going on? I'll go over the details in a bit, but let me summarize. NEC Display Wall Calibrator requires software - the type of software that you expect to get from a device's documentation. Any configuration (or configuration software) that you download or purchase from NEC Display Wall Calibrator should specify which software it will and will not work with. In short, it is up to the vendor to properly configure their devices. If the vendor sets up their device as if it could be used with only the type of software they sell, it will not work with other software. This includes other PC software such as ICPro PT. NEC is notorious for this, but it does crop up from time to time. If you download and use data files such as a CIE1931/1 or CIE9431/2 profiles and configuring software such as X-Rite's i1Display2, you will be able to use the Wall Calibrator with the software and hardware you purchased. This is something NEC does not do properly or at all.

Nec Display Wall Calibrator Serial Number

Center 0,1 0,-0.2779 0.0739,-0.4990 0.6651,-0.4979 Nec Display Wall Calibrator Serial Number The Wall Calibrator site will download an ICC profile and optionally verify it. The second page of the report is the Gamma calibration report. Again, this report is different from the PD series report. A sample Gamma calibration report is shown in Figure 8. Like the luminance report, the Gamma report is also unique for each individual monitor since it is reporting different monitors gamma curve for calibration. The monitor also compares between its own result and the target result at each of the 25 measurement points, and a color correction curve is automatically calculated and applied to increase the effective gamma level. All 25 measurement points are displayed with the Gamma correction curve in a special graph (see Figure 9). The lower half of the diagram is the gamma curve, and the upper half is the target gamma curve. The Gamma correction curve is used to smooth the display from black to white, thereby increasing the effective gamma level. On the right side of the Gamma calibration report, there is an important item, named Color Difference, listed in Figure 9. This color difference is measured at the center point, which is labeled no. 13 in Figure 9. The color difference is compared to the target gamma curve, and we can see that the color difference in terms of Delta E is less than 1, so there is no visible coloration or tint when displaying a full white. Hence, we can conclude that the monitor has good color performance. The next section on the report, called Color characteristics, contains the 3 measured colors, namely RGB (Red, Green, Blue), with each measured result for each of the 25 measurement points. This includes the luminance of the red, green, and blue component. There are also two important parameters in this section named Green, the color temperature, and White, the luminance of white, which are measured, and then compared to their target numbers. The color temperature measures the white balance of the monitor. For example, if the color temperature is 6700, it means the white balance setting has been adjusted to neutral, meaning, there is no color temperature change from the factory default setting. The Luminance of white is a reflection of the intensity of the white light (intensity of full white), which corresponds to the gray level that will be displayed by the monitor. 5ec8ef588b
