steps for solving pre-algebra problems are given in the book as well as the types of questions which can be solved easily without checking the answers and other questions which can be solved by writing either the equation or by showing the method of solution (e.g. step-by-step method). these, in addition to the explanations, lead students to grasp the concepts with ease. chapter 5 of the rd sharma textbook begins with the rational numbers. this is followed by the addition of rational numbers. the next step is the rational numbers with same denominator. this leads to numbers with distinct denominators. subtraction of rational numbers, multiplication of rational numbers and division of rational numbers are explained, along with the reciprocal of a rational number. the summation of a series of rational numbers and vice versa are explained as well. examples for rational numbers, numbers and sums of rational numbers are given. students can also find the solutions of questions here to understand the concepts better. in this chapter students will also find the process of finding the place of a value in a number line and in a number interval. they will also learn what is meant by the diameter of a number set and the perimeter of a number set. this helps them in grasping the concepts quickly. in addition, students will get to know the different types of number lines and number intervals. the solutions of various questions are given. in addition to the definitions, students can also be taught about the permutations and combinations of a given set of objects. this is followed by the transitive property of operations. this chapter also deals with the congruency of number sets, computation of a fraction with a mixed numerator and denominator. divisibility tests of arithmetic progressions and modulo operations are explained in this chapter.
