**Goldmaster Rc 451 Driver 15 Fix**

[Download](#)

---

this issue is caused by a change in the default behavior of windows devices, and not a change in the actual driver architecture. the default setting of windows devices is to require administrative privilege to install drivers. this issue occurs when a print driver on the print client and the print server use the same filename, but the server has a newer version of the driver file. when the print client connects to the print server, it finds a newer driver file and is prompted to update the drivers on the print client. however, the file in the package it is offered for installation does not include the newer driver file version. the following mitigations can help secure all environments, but especially if you must set `restrictdriverinstallationtoadmins` to 0. these mitigations do not completely address the vulnerabilities in `cve-2021-34481`.

---

windows updates released august 10, 2021 and later will, by default, require administrative privilege to install drivers. we made this change in default behavior to address the risk in all windows devices, including devices that do not use point and print or print functionality. for more information, see point and print default behavior change and cve-2021-34481. windows updates released august 10, 2021 and later will, by default, require administrative privilege to install drivers. we made this change in default behavior to address the risk in all windows devices, including devices that do not use point and print or print functionality. for more information, see point and print default behavior change and cve-2021-34481.

**Goldmaster Rc 451 Driver 15**

---

Goldmaster RC451 driver from Goldmaster labs. This is a beta version, so it is not currently a standalone kit with memory stick or whatever you would normally find. This is an early beta of its kind. There is no documentation and it is not a finished product. Support in our forums is being assembled. Contact us here in the forums with your issue. Also do not try to buy this software. It may not work. Even though the drivers are apart of the Pi since the end of April 2013, this may not be the final version. Buyer beware, you will need to already own a Goldmaster 90, Goldmaster 100, Goldmaster X1000, Goldmaster X1000 SE, or Goldmaster X11000 in the past. You will need an existing Goldmaster Mini interface, if you do not already own one. You can purchase one here from the website here:

<http://www.goldmasterlabs.com/> The support forums are here: <http://www.goldmasterlabs.com/support-forums/> I also have the same problem. In version 6.92, Mac OS, Ubuntu and windows can all work normally. After upgrading version 6.10, Mac OS and Ubuntu can normally drive the independent display. Only windows has an error. The graphics card can output pictures to the display, but the installation of the graphics card driver will send an error 43. I tried to rollback to version 6.92. Everything is normal. The independent display can be used normally A workaround can be done, but is a temporary one. The workaround is: close the print manager if needed, reboot the computer then in the print manager, click the Driver Settings button in the top left-hand corner click Software Download and Scan you will see several drivers listed, which include

---

the one you want to install, and it will have the Windows logo next to the driver name click the driver that has the Windows logo next to it, and then click the Install button The rest of the install will occur automatically after installation, restart the computer go back to the print manager, and go to the Properties tab click the More Settings button check the box next to the driver you installed click OK go back to the Properties tab click the Apply button at the bottom of the driver's name wait a few seconds if all goes well, you should see a green check next to the driver's name
